Batten College of Engineering and Technology*

The 30 Minute Game Plan...

Part 1 – Project Overview

Part 2 – Flood Vents

Part 3 – Clustered Green Space Buyouts

Part 4 – Raising Structure BFE

Part 5 – Key Takaways

Part 1 – Project Overview

General Project Objectives

- Develop an approach for answering specific research questions.
- Exploratory -- to think through the practical social, political, and financial hurdles to adopting these practices.
- Project is underway -- analyses are forthcoming.

Specific Project Objectives

- Measure the return on investment (ROI) for deploying selected resilient building codes and development practices.
- Compare current practices to phased intervention practices:
 1. Flood Vents
 2. Clustered Green Space Buyouts
 3. Raising Structures

Part 2 – Flood Vents

Research Questions

What is the expected reduction in damage from continued adoption of flood vents under several storm scenarios?

How do these reductions in damage translate into reduced displaced populations and health savings?

Updated HAZUS Inventory

- Refined HAZUS inventory foundation types to better reflect ground truth.
- Applied one of these to each Census block:
 - 100% Crawl
 - 100% Slab
 - 90% Slab/10% Crawl
 - 89% Crawl/11% Slab
 - 66% Crawl/34% Slab
 - 93% Crawl/5% Basement/2% Slab

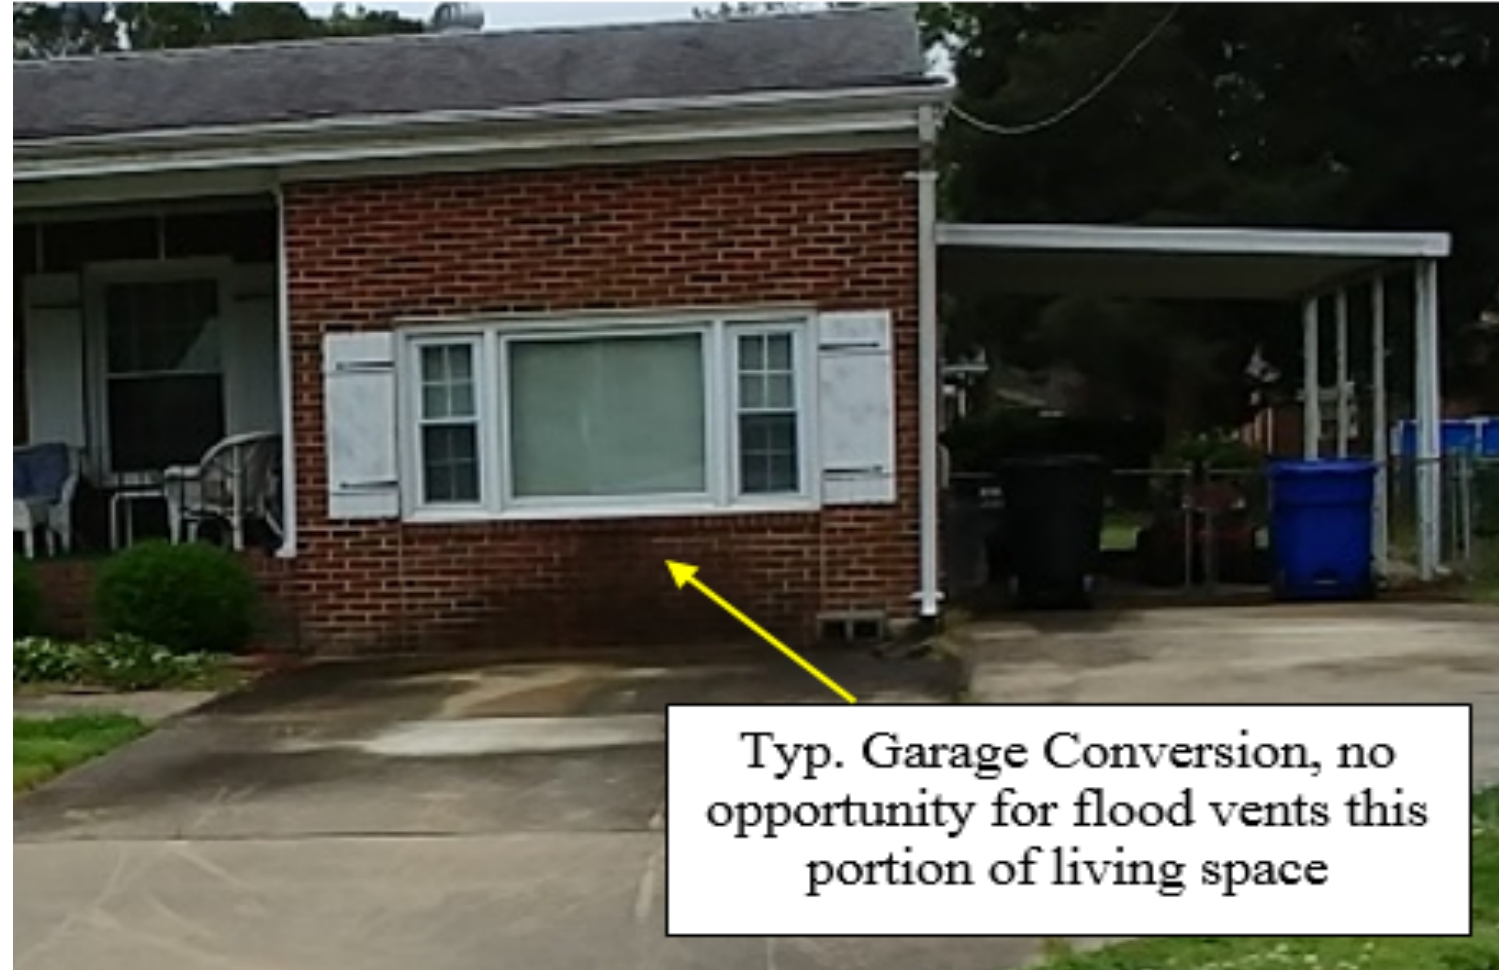

Updated to reflect actual foundation types in study area.

Mixed Category Foundations

Example...

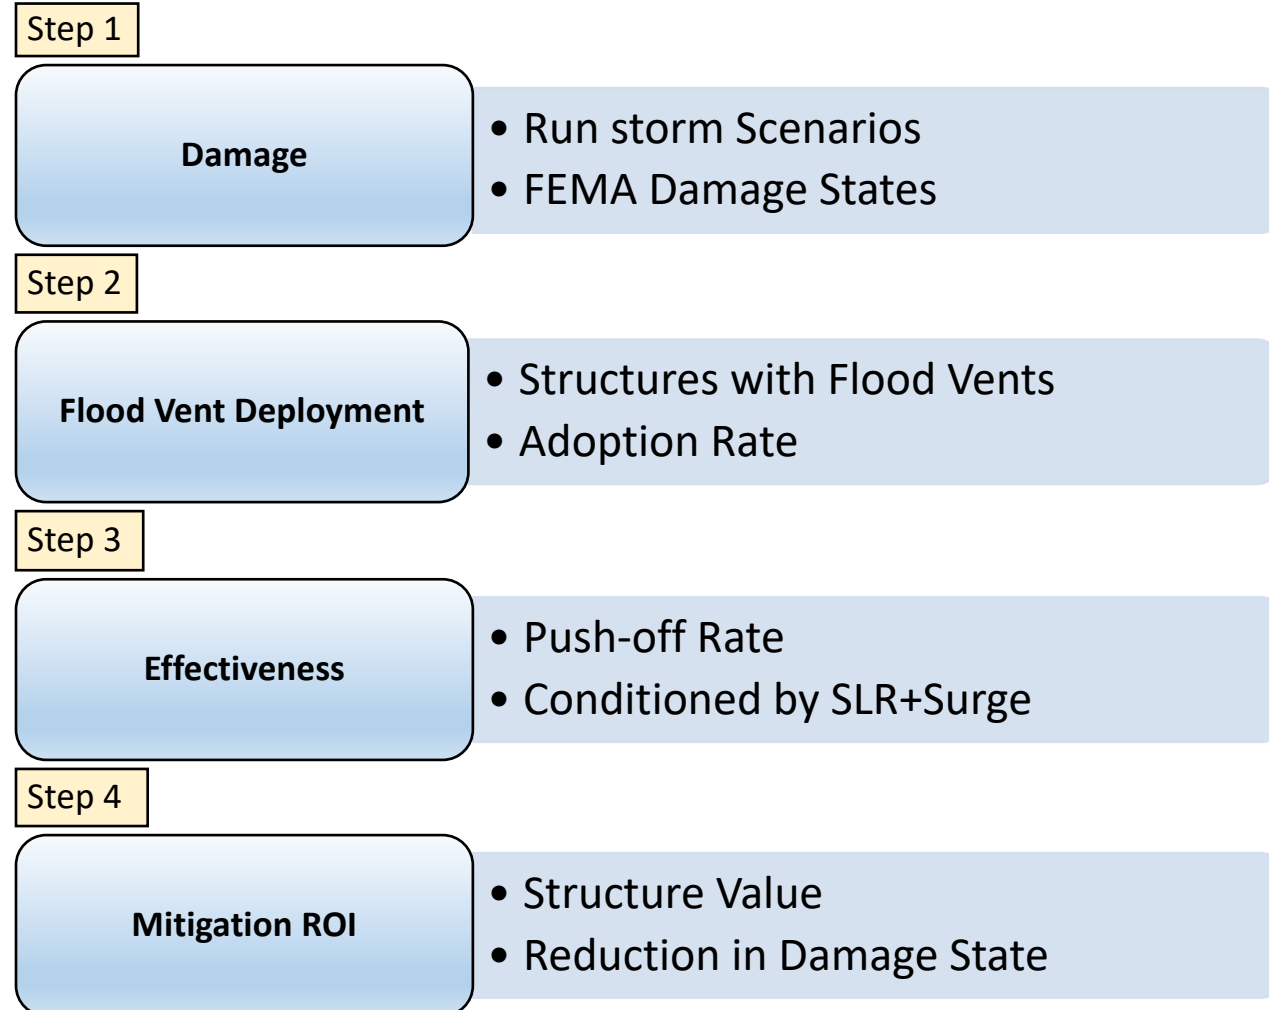

Mixed Category Foundation

The High Level Process

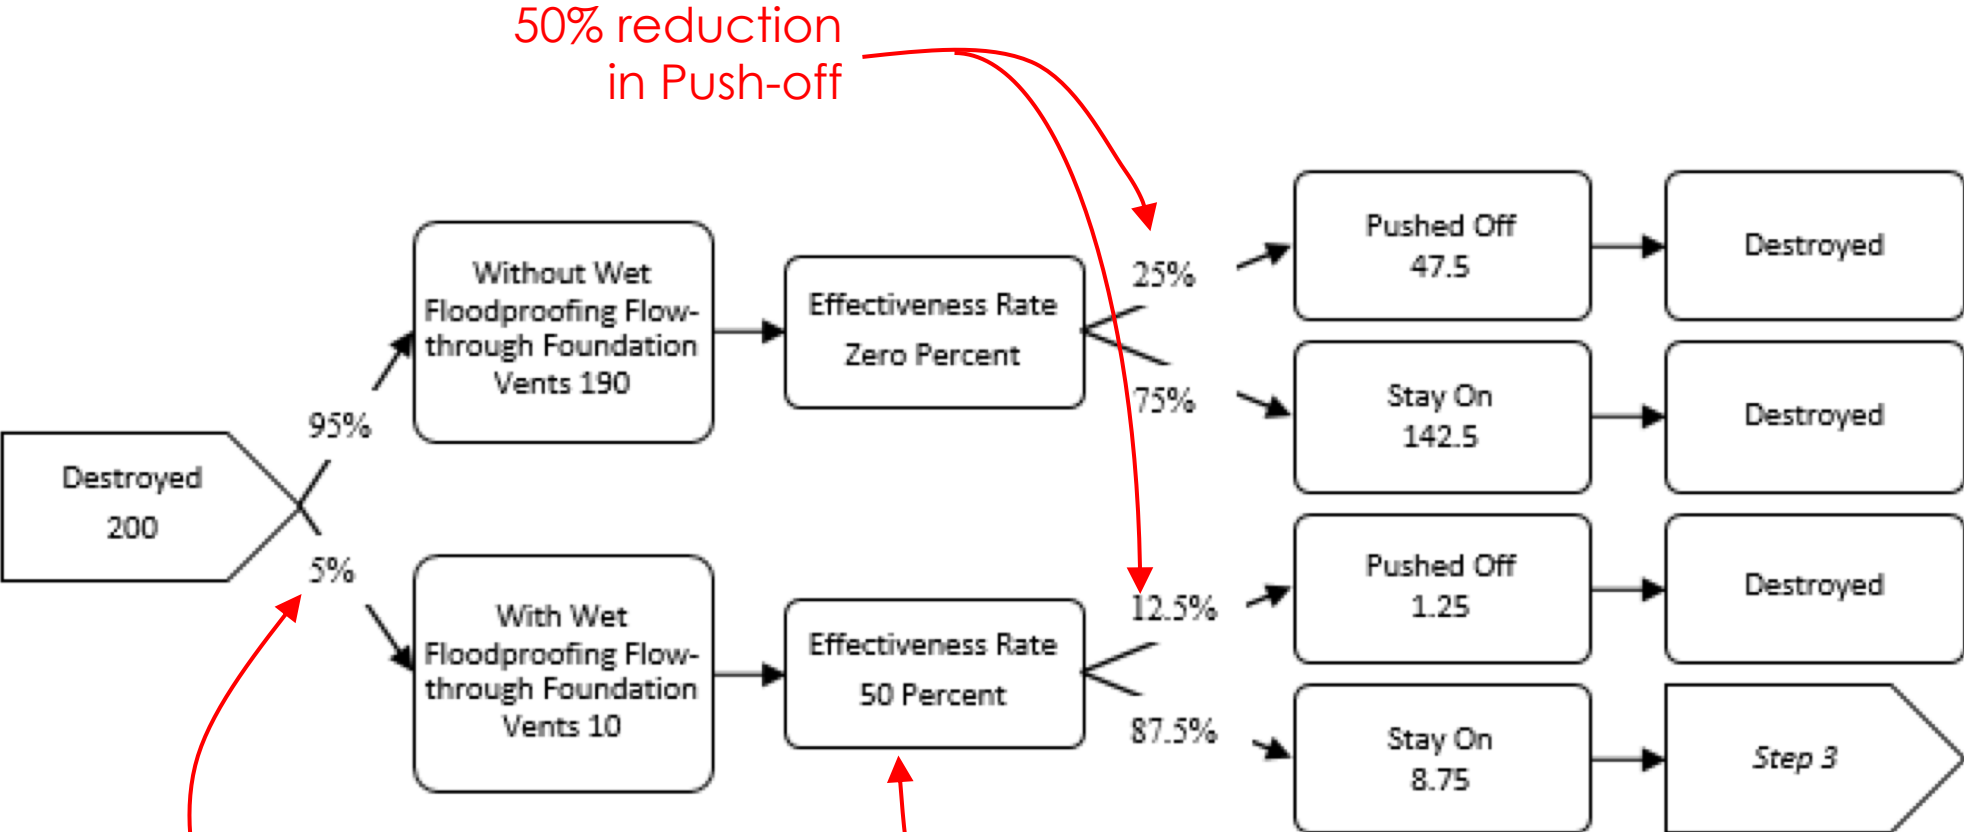

The Process

The Process

Initial Base – Adoption Rate Changes Overtime

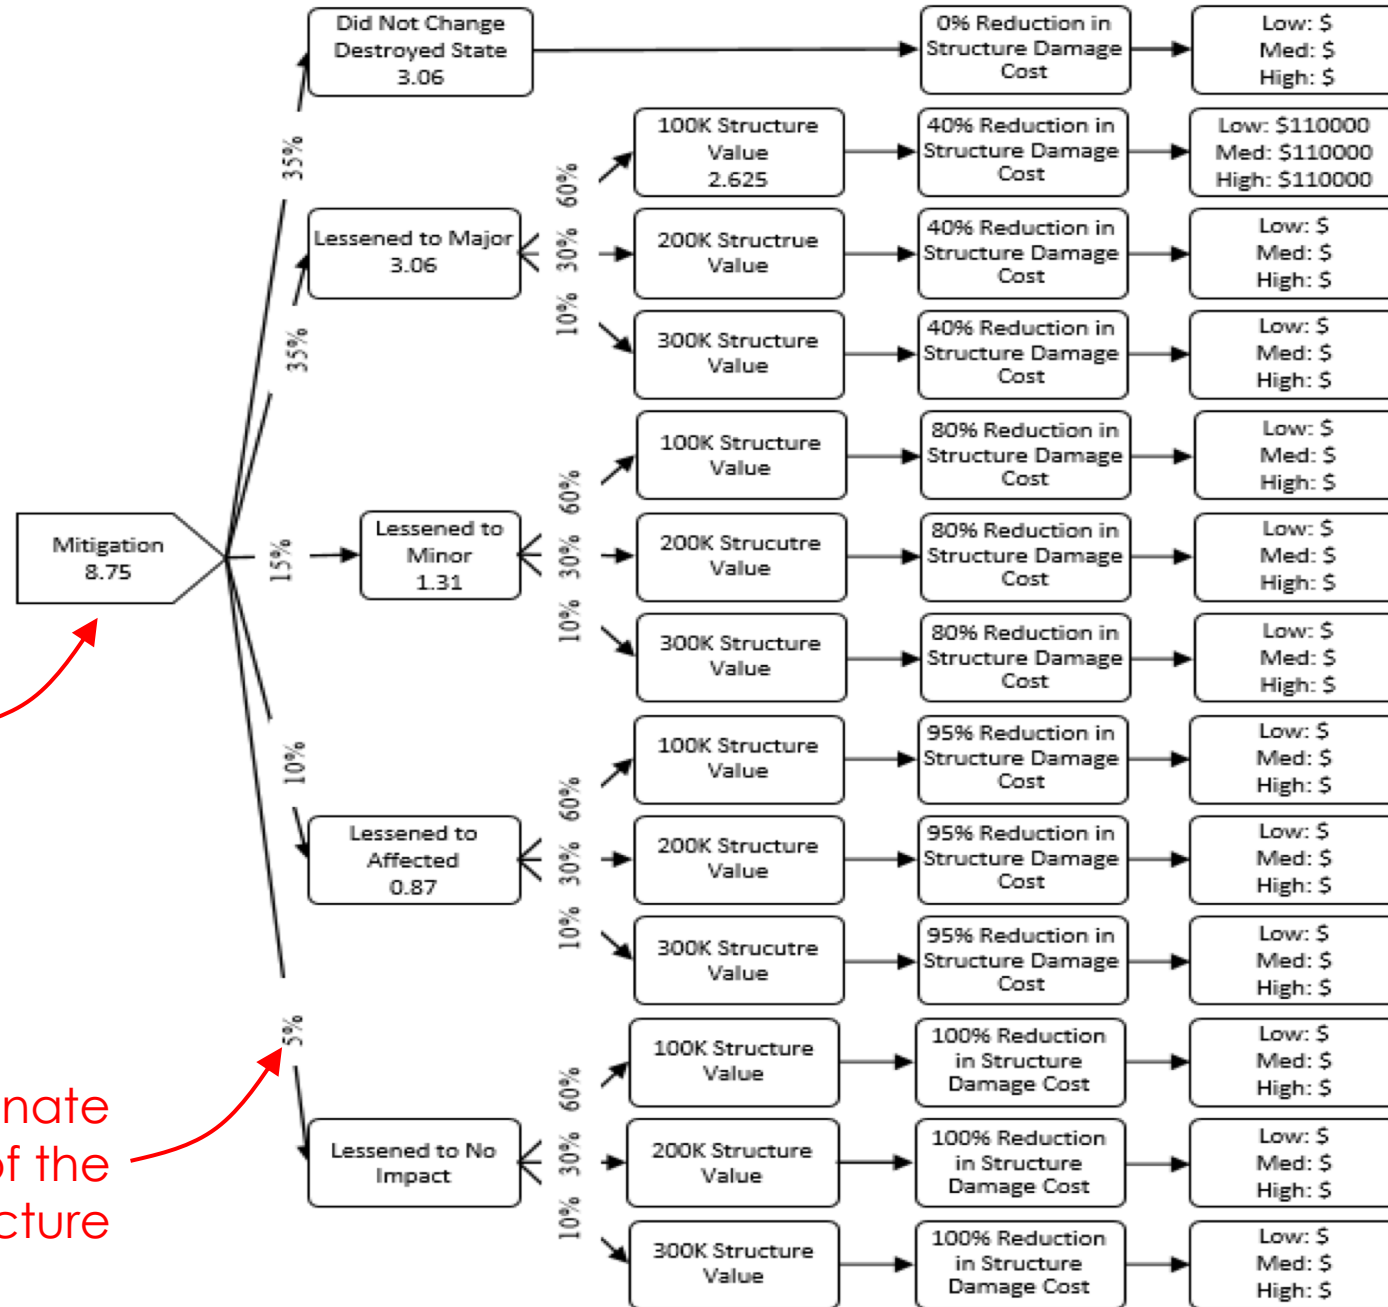

How do we establish the Effectiveness Rate?

The Process

This is the number of structures that otherwise would have been pushed off

Vents rarely eliminate entirely the impact of the event on the structure

Obstructions: LNFOs and SNFOs

Large Non-fixed Objects (LNFOs)

Small Non-fixed Objects (SNFOs)

Definition:

- Items surrounding the structure that may be moved by the force of moving water or buoyed by rising water.
- When moved by water, these objects can impede the effectiveness of the vents by blocking the flow of water and/or interfere with the mechanical functioning of the vents.

- Flood Vents typically within 12" of finish grade.
- Often proximate shrubs and flower beds.

LNFOs

LNFOs

Raised Structure on Relatively Small Lot, Proximity of Fencing Material

LNFOs & SNFOs

SNFOs

- Fixed Structure Objects – Natural Gas

Flood Vents with
Natural Gas Plumbing

- Fixed Structure Objects – Electrical Service

Flood Vent with
Service Line Conduit

Part 3 – Clustered Greenspace Buyouts

Research Questions

What is the expected reduction risk, over time, from implementing a clustered buyout program?

How do these reductions in damage translate into reduced displaced populations and health savings?

Scenarios

3 Storm Scenarios:

- Historic storm: 1933 Chesapeake-Potomac
- Quasi-historic storm: “Sandtrina”
- Quasi-historic storm: “Hugoswan”

Storm scenarios simulations:

- Current conditions
- 2' SLR

Green Space Adoption

- Run HAZUS scenarios
- Identify green space adoption areas based on substantial damage estimates
- Select residential parcels for purchase/buy-out and estimate costs
- Adjust damage estimates based phased adoption of green space
- Report adjusted damage estimates.
- Report estimated displaced populations
- Estimate discontinuity of medical regimens and public health cost.

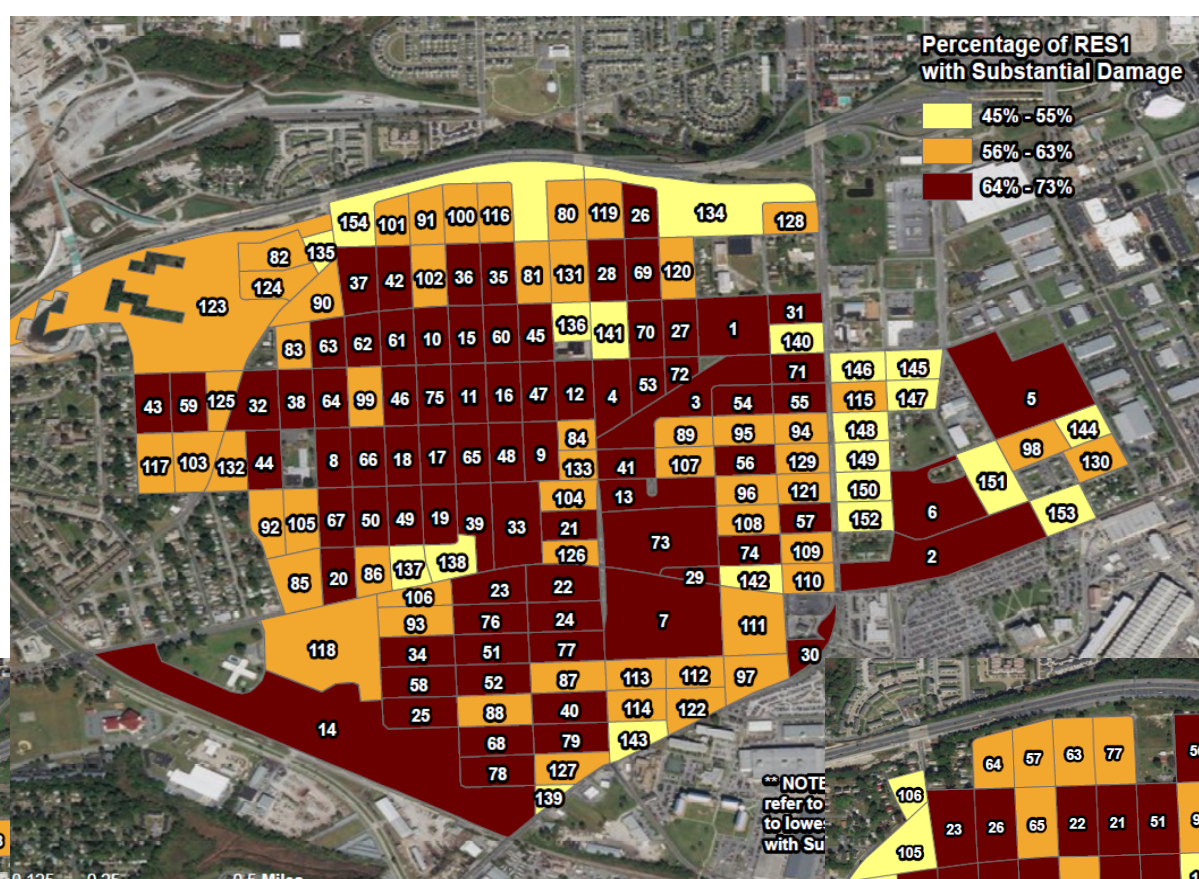

Algorithm to Identify Target Buyout Cluster

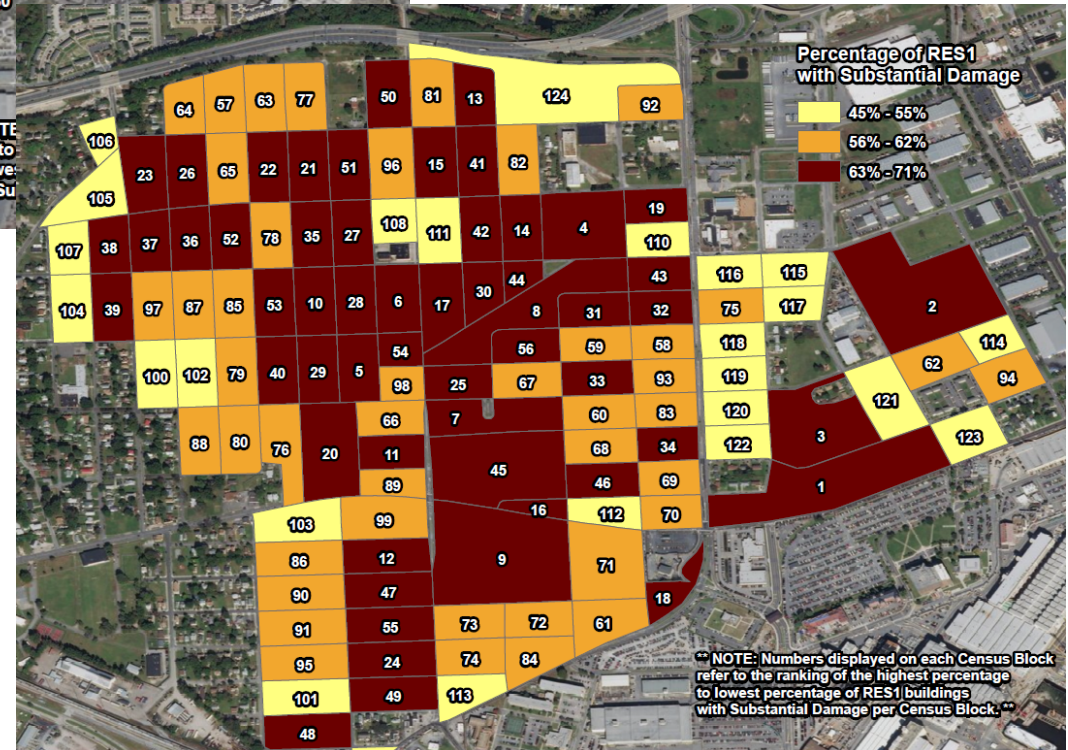

- Step 1: Run the 33 Chesapeake-Potomac storm, the Hugo storm, and the Sandtrina storm scenario, each with 2ft sea level rise.
- Step 2: For each storm, identify city neighborhoods with residential structures characterized with substantial damage; identify blocks that receive substantial damage from all three storms
- Step 3: Further identify all blocks that receive substantial damage to greater > 57.0% to Res1 structures.
- Step 4: Within these selected Step 3 blocks, identify all blocks that contain only Res1 and Res2 structures; that is, blocks that are 100% Res1 and Res2.
- Step 5: Within these selected Step 4 blocks, identify any clusters of five or more contiguous blocks.
- Step 6: Identify any blocks proximate to the cluster that: 1) are > 57.0 percent substantial damage to Res 1 structure, 2) have one or more sides of the block's polygon perimeter shared with blocks within the identified cluster, and 3) contain two or fewer non-residential structures (e.g., commercial, religious, agriculture). Include these blocks in the cluster.

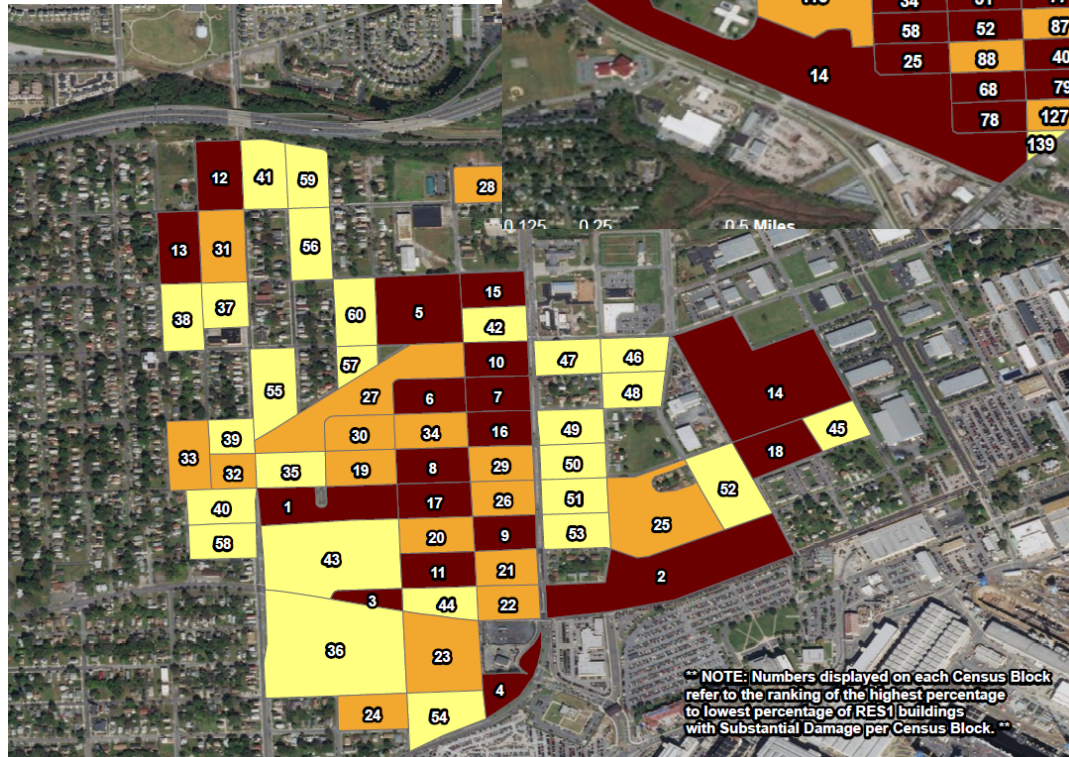

Sandtrina with SLR

Chesapeake-Potomac with SLR

Hugoswan with SLR

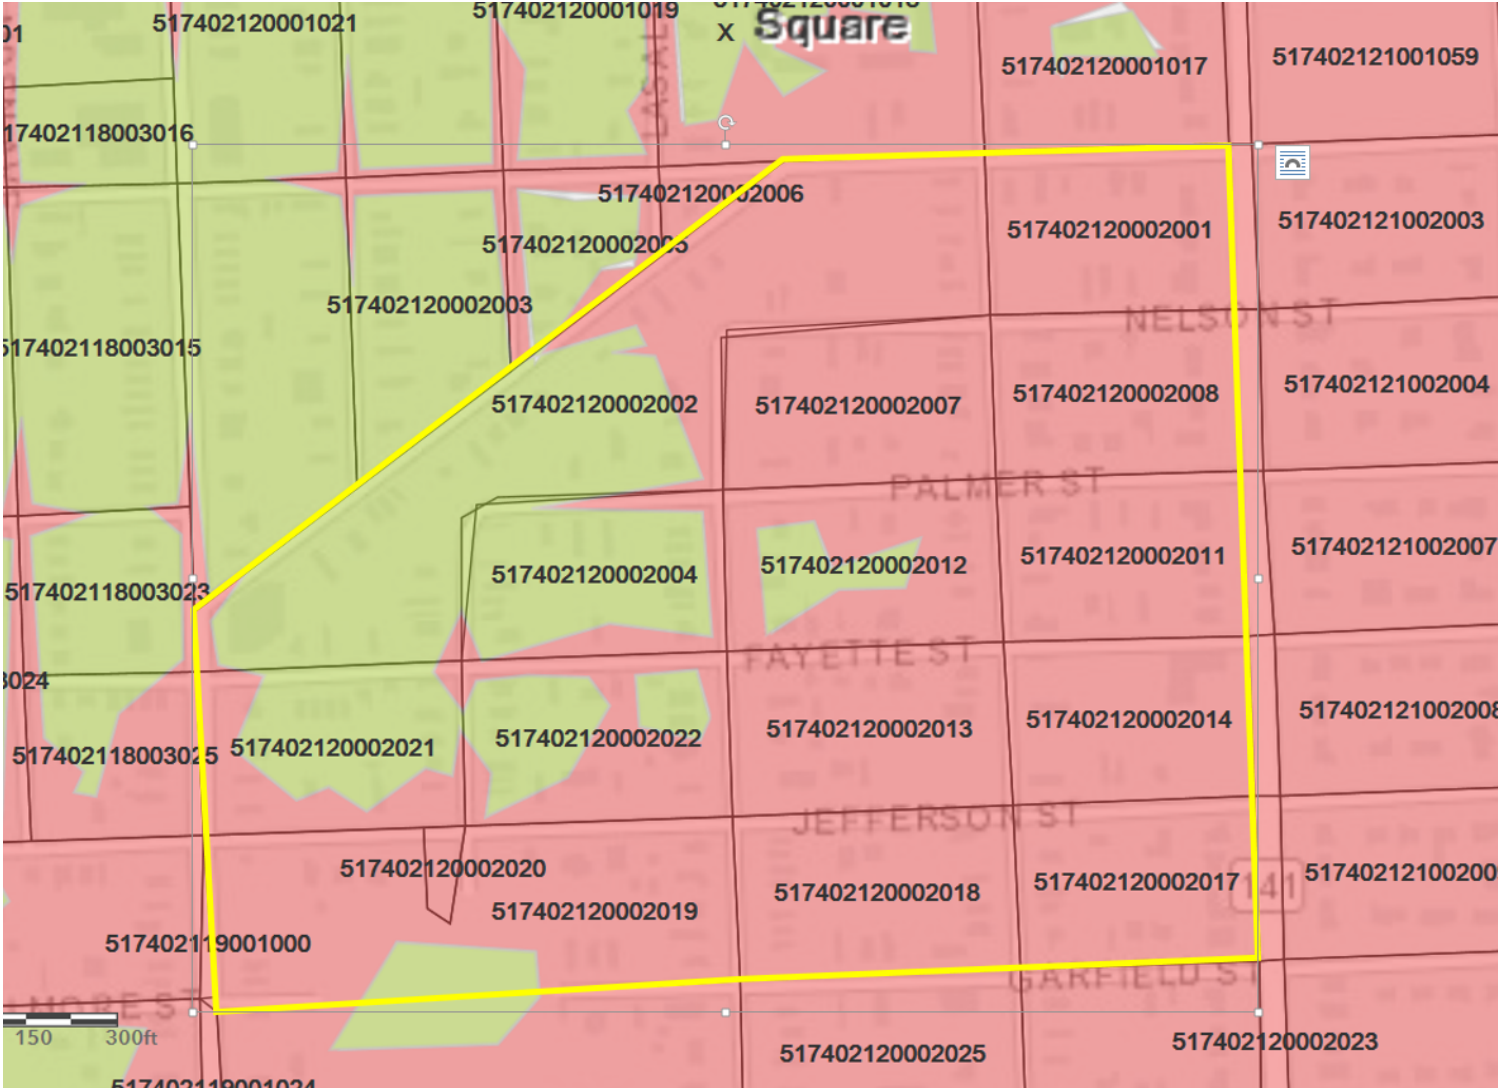

Optimized High Risk Clustered Blocks

Relationship to AE Zone

Establish Parcel Property & Structure Value

Greenspace Adoption

Shallow
Basin

Part 4 – Raising Structure BFE

Research Questions

What is the expected reduction in risk, over time, from implementing raising existing structures and requiring new construction using increased BFE?

How do these reductions in damage translate into reduced displaced populations and health savings?

Raising Structures

- Run HAZUS scenarios
- Identify % of new homes in study area
- Adjust damage estimates based phased adoption of elevated structures
- Report adjusted damage estimates
- Report estimated change in displaced populations
- Estimate change discontinuity of medical regimens and public health cost.

Secondary Tradeoff Issues

- Risk from height of structure
 - Risk of acute injury is greater due to stair height.
- Structure will not meet needs with onset or instantaneous mobility issues.
 - Height will not accommodate retrofitting with ramps.
- Ingress/egress of emergency responders.
- Over time, the pool of homes accessible to those with mobility impairments shrink.
- Insurance tradeoffs.

Stair System

Example...

Increased Porch Risers

Example...

New Construction,
9 risers to front porches
(note 14" tread)

Part 5 – Key Takaways

Flood Vents Takeaways

1. Foundation type and zone limit number of potential structures.
2. Adoption rate conditioned by property value, ownership, and risk perceptions.
3. Reduction in risk is conditioned by the concept of effectiveness.

Clustered Greenspace Buyouts Takeaways

1. Identification of buyout balances multiple, often competing, constraints.
2. Advantages to clustered approach are open space and enhanced livability.
3. Open space plan may be shelf-ready after an event.

Raising Structure BFE Takeaways

1. Need to better document secondary health and insurance tradeoffs.
2. Decrease pool of housing options for those with mobility limitations, elderly, and young families with children.
3. Increased insurance.

Thank You!
